Chapter 2

Introduction To The Hardware

The ezLCD module contains a GPU and related circuitry to drive a LCD display, USB interface

Internal 4mb MSD flash drive for storage of fonts, bitmaps and macros.

Display can be controlled through USB CDC Serial or TTL 3.3v Serial .

Commands are sent to the ezLCD through the serial interface, Commands are text based and end with a carriage return **cr**.

So if you send **cls** ending with a **cr** the device will clear the screen and return a **cr** when the command is complete, some widgets take a bit of time (in the millisecond range) to complete so after sending a command always wait for a **cr** to come back before sending another command.

Chapter 3

Introduction To The Software

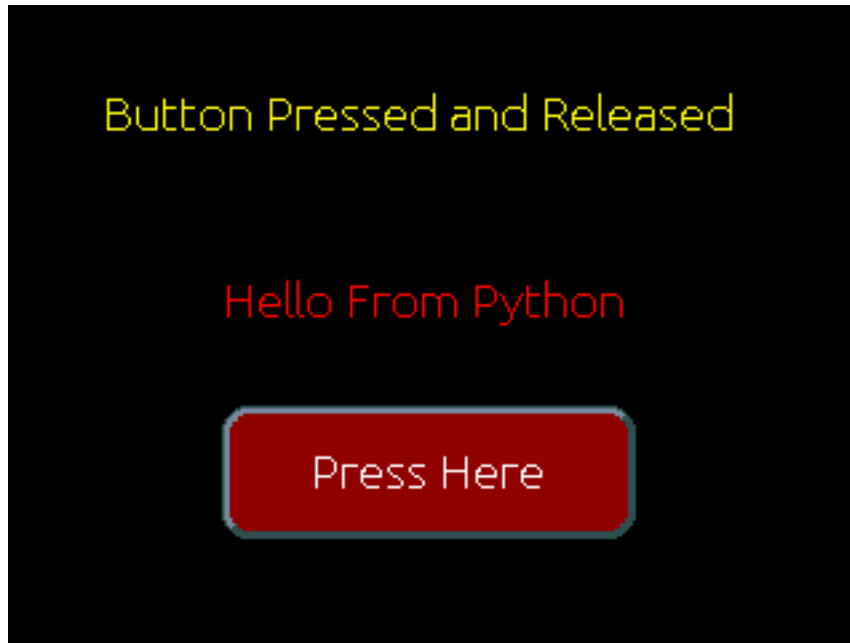

Minimal example will open the ezLCD port clear the screen and print 'Hello From Python' in red

```
